

NEW HONEY PRODUCT SPREADS LIKE BUTTER

ITHACA, N.Y., Jan. 4.

The discovery of a new method of preserving honey as an opaque, grey-white butter instead of a golden liquid was announced on Saturday at Cornell University.

The new product, called crystal honey, has a slightly different flavor; it neither drips nor spreads sticky and has been offered by the university to the honey industry.

The discovery is the accomplishment of a young Canadian, Dr. E. J. Dyce, who made a gift of the process to Canadian honey producers and to Cornell.
